

HORIZON S.A. participates in the research project “Green Residues Supply Chains for bioenergy exploitation”, with the acronym «AgroChains», in the frame of the Action “RESEARCH – CREATE – INNOVATE” and will be conducted in the years 2018-2021.

The project has as main objective the development, implementation and evaluation of biomass supply chains from green residues for the production of energy products (solid biofuels, energy) through specific field trials, testing of energy exploitation technologies and related techno-economic and environmental assessments.

For the implementation of the proposed project, two major categories of biomass were selected, straw and corn residues, as well as pruning, including urban tree’s clearing and forest residues. The project will be implemented in three prefectures: Serres, Imathia and Karditsa where there are sufficient quantities of all the residue types that concern the project. Furthermore in these areas there is already interest in the management and utilization of the residues from existing biomass utilization units or there is the possibility of using specialized equipment.

The following partners participate in the project: Στο έργο συμμετέχουν επίσης οι εξής εταίροι: CRES, CERTH, ANKA S.A.
